The image shows the cover of a Siemens brochure for UPS Solutions. The top section features the Siemens logo in blue and white, with the text 'UPS Solutions' in large white letters and 'Uninterruptable Power Supply' in smaller white letters below it. The background is a photograph of a traffic intersection with a yellow bus and a traffic light. A large, semi-transparent 'DRAFT' watermark is overlaid diagonally across the center. Below the title, the URL 'siemens.co.uk/traffic' is displayed. The main body of the brochure contains several sections of text and a list of features. The text describes the reliability of Siemens UPS solutions for traffic intersections, the scalability of the backup power supply, and the automatic switching from mains to backup power. A list of features includes: Scalable capacity to suit intersection loads of up to 200W, ideally suited to LED sites, automatic and transparent switching from mains to backup power with no interruption to intersection operation, support for easy connection of auxiliary power sources for extended hold up performance, housed in standard ST95D controller cabinet, and UPS fault and status reporting via Siemens BMS and UTC. The URL 'siemens.co.uk/traffic' is repeated at the bottom right of the brochure.

Uninterruptable Power Supply

siemens.co.uk/traffic

Siemens Uninterruptable Power Supply (UPS) solutions provide reliable backup power for intersections where Siemens traffic controllers are installed, ensuring that full traffic control is maintained during mains power failures.

Power failures at critical intersections can result in traffic chaos and increased accident risk as the control exercised by the traffic signals is no longer operational.

The Siemens range of UPS solutions provide back up power to such intersections in the event of a supply failure.

Scalable solutions

The capacity of the backup power supply has a large influence on the overall UPS cost. With Siemens UPS solutions, the load capacity and support times required are scalable to suit individual site requirements. For small to medium sized intersections the UPS can be accommodated in a single ST95D style cabinet. For large sites a second cabinet may be used to hold additional batteries.

Each cabinet is suitably vented and to ensure maximum capacity, even under very cold conditions, a heater is provided to maintain cabinet temperatures within power limits.

Automatic switching from mains to backup power

When mains power is present the UPS system maintains the charge in the batteries at an optimum level, helping to maximise battery life.

In the event of a power failure the system switches transparently to the backup batteries without interrupting the power to the traffic controller, ensuring there is no disruption to normal traffic control. On restoration of the site power the system automatically (and transparently) switches back to main power and begins to re-charge the batteries.

Supports auxiliary power sources

Where required the UPS cabinet can be equipped with an industry standard power connector to allow auxiliary power sources (such as standby generators) to be used to augment the support time in the event of extended power failures.

- Scalable capacity to suit intersection loads of up to 200W
- Ideally suited to LED sites
- Automatic and transparent switching from mains to backup power with no interruption to intersection operation
- Supports easy connection of auxiliary power sources for extended hold up performance
- Housed in standard ST95D controller cabinet
- UPS fault and status reporting via Siemens BMS and UTC
